Day: 17 (04-11-2026)	**Data Loading, Transformation and Visualization using PowerBI**	Documented By:
Task – 3		Sujit T K

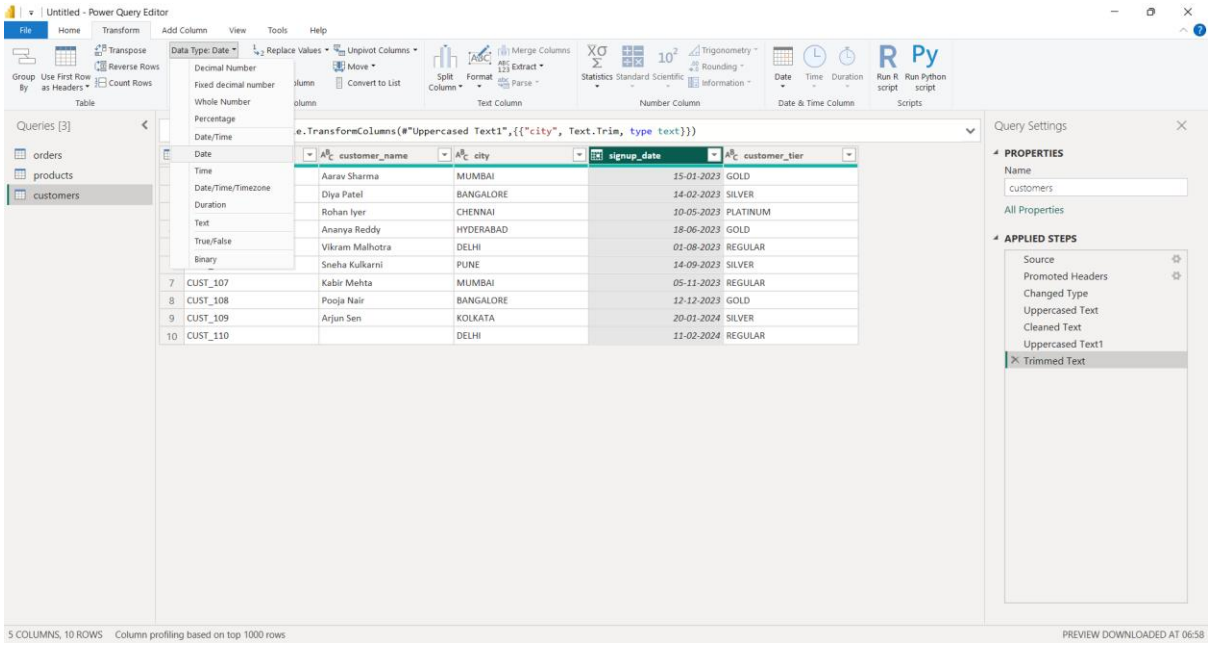

1.) Load .csv data into Power Query Editor

2.) Perform Transform operations such as UPPERCASE, TRIM

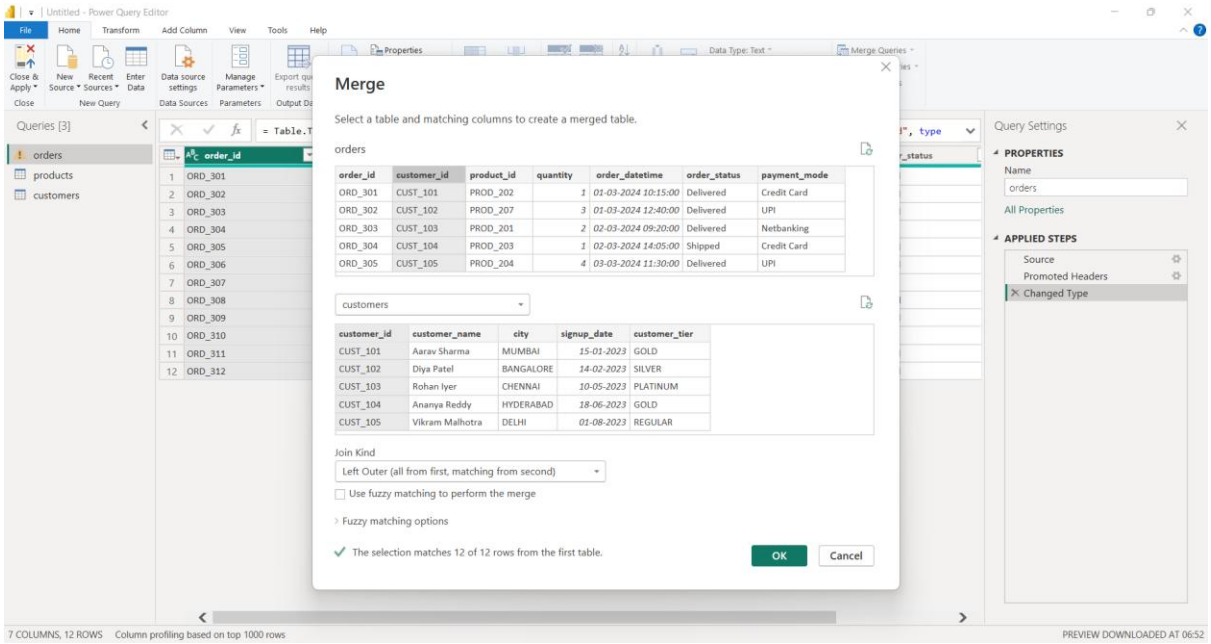

3.) Convert datatype of each column to its appropriate format (signup_date column should be of date datatype)

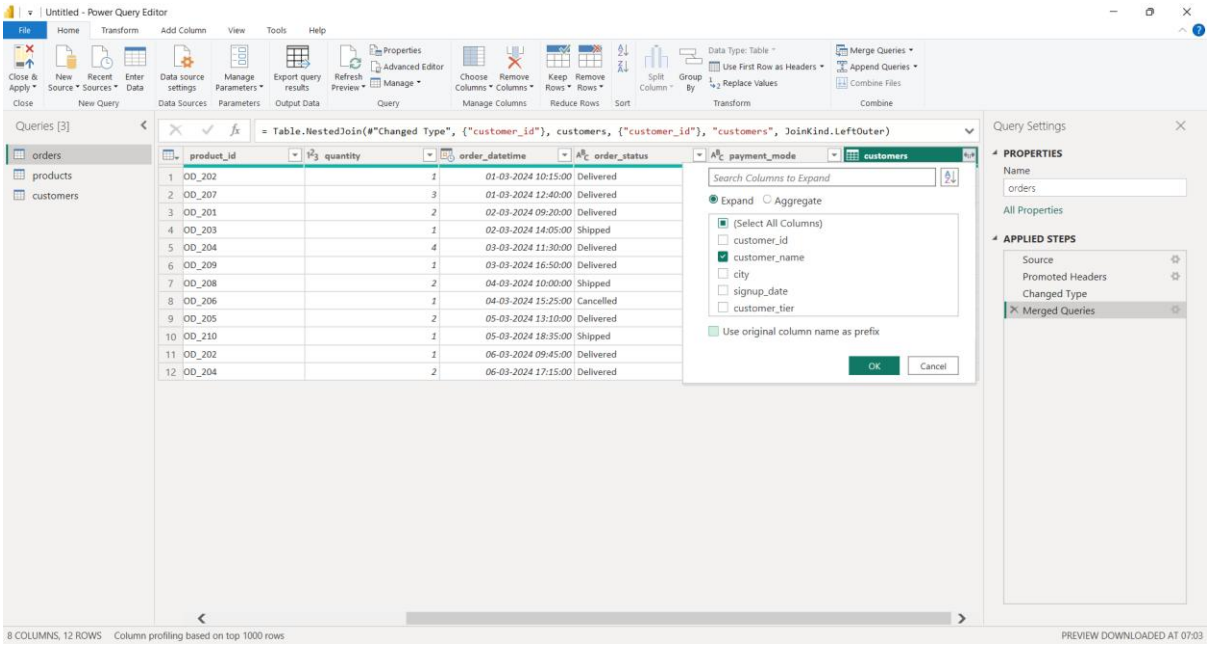

4.) Merge tables using common columns

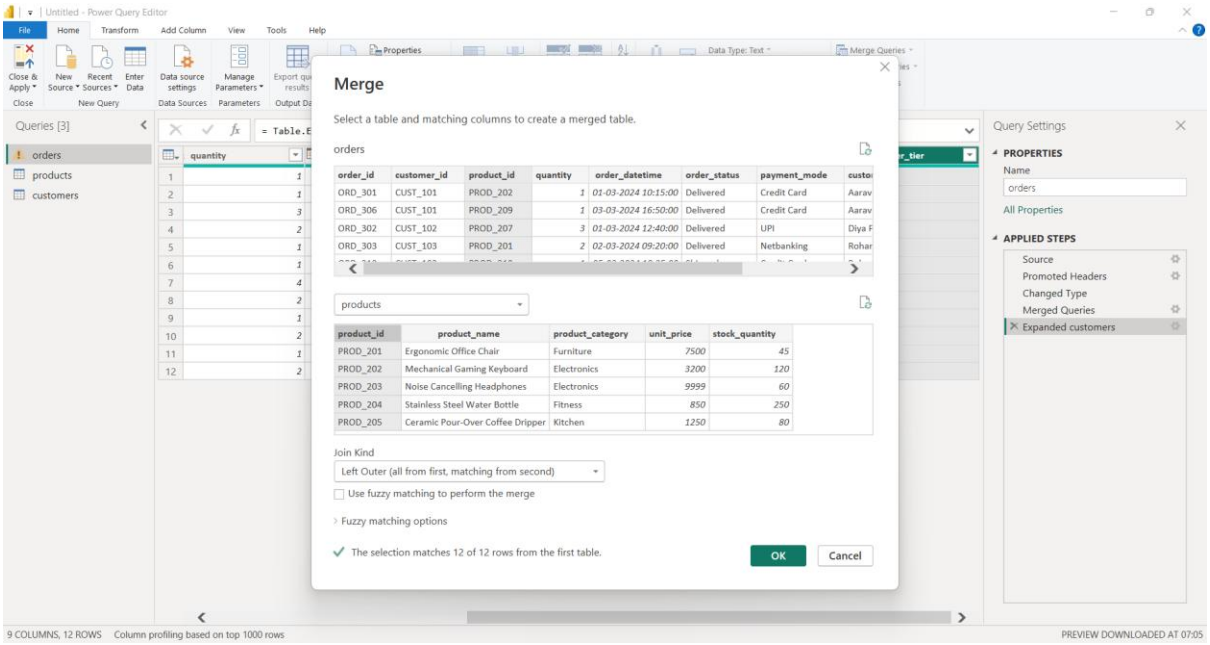

4.1.1) Merging Orders and Customers table using customer_id common column

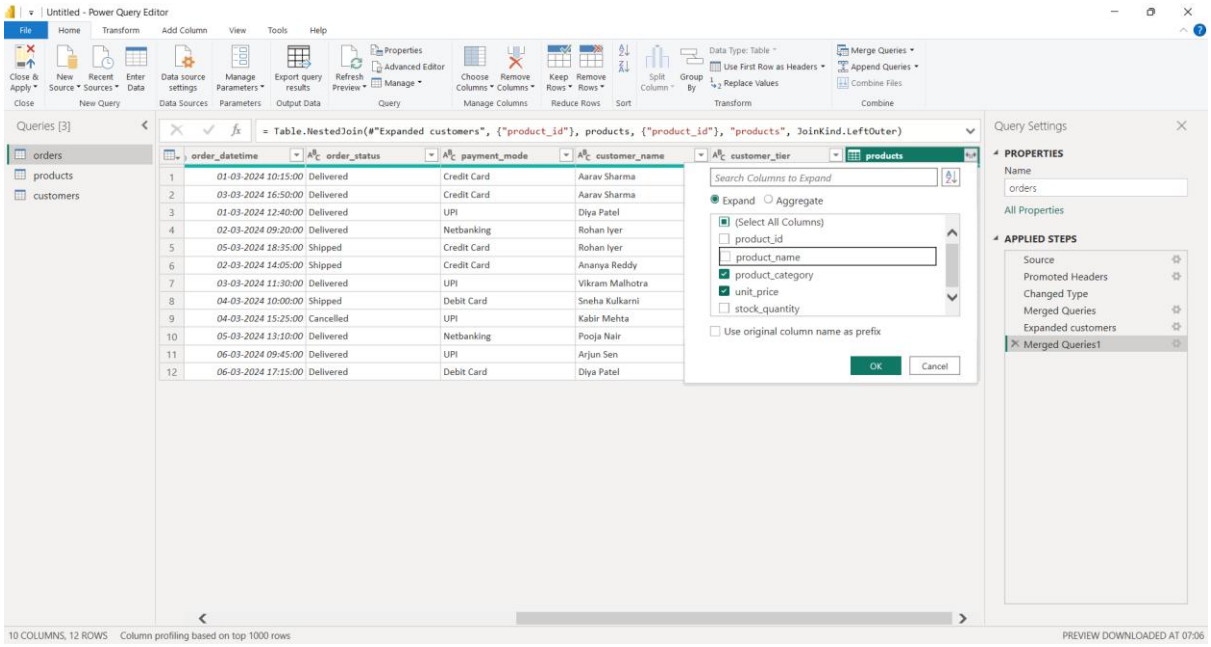

4.1.2) Select only the necessary columns

4.2.1) Merging Orders and Products table by common column product_id

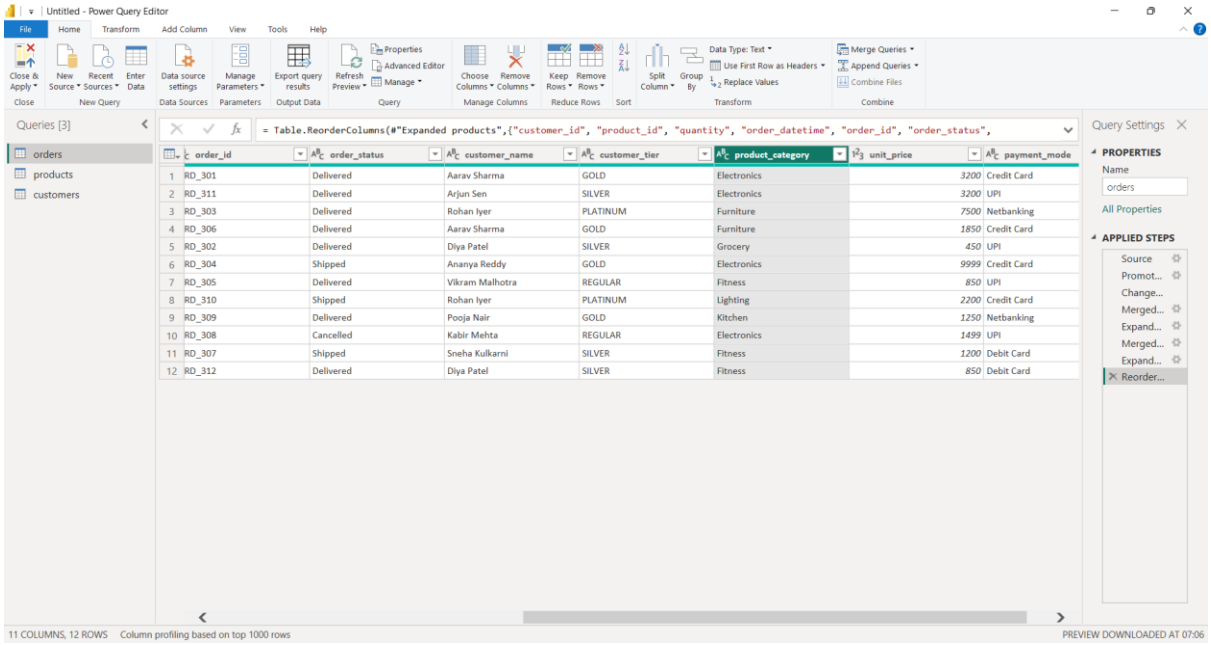

4.2.2) Select the necessary columns to be displayed

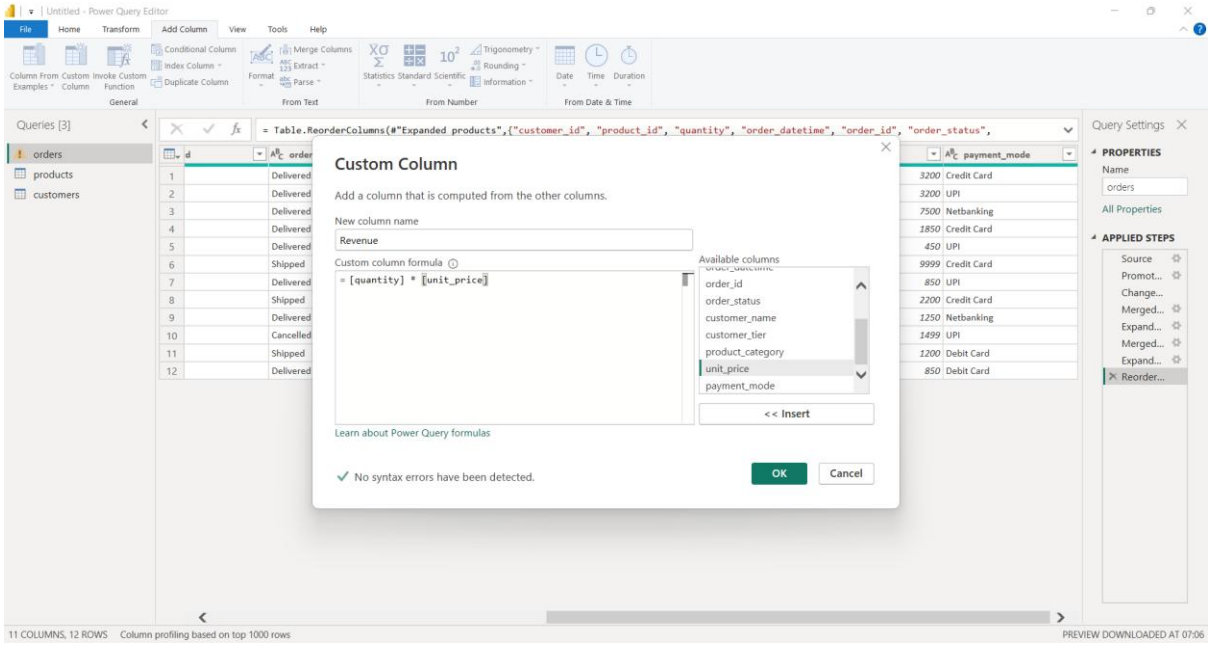

5.) View the table content to verify all required columns are present

customer_name and customer_tier are from Customers table

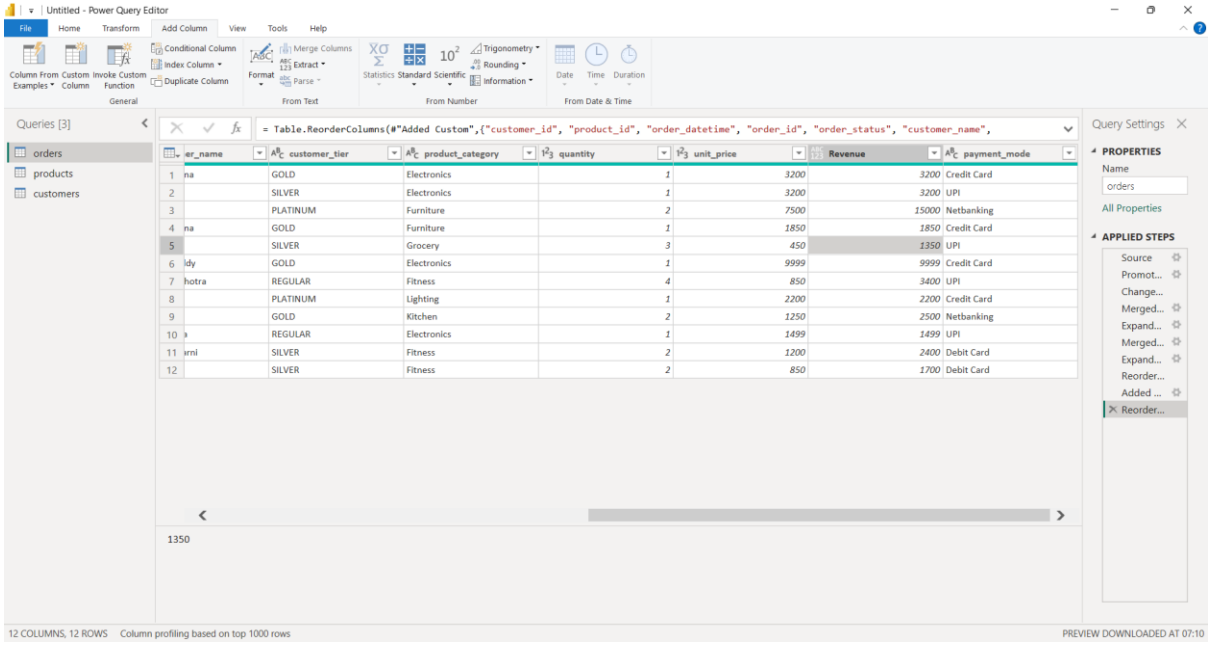

unit_price and product_category are from Products table

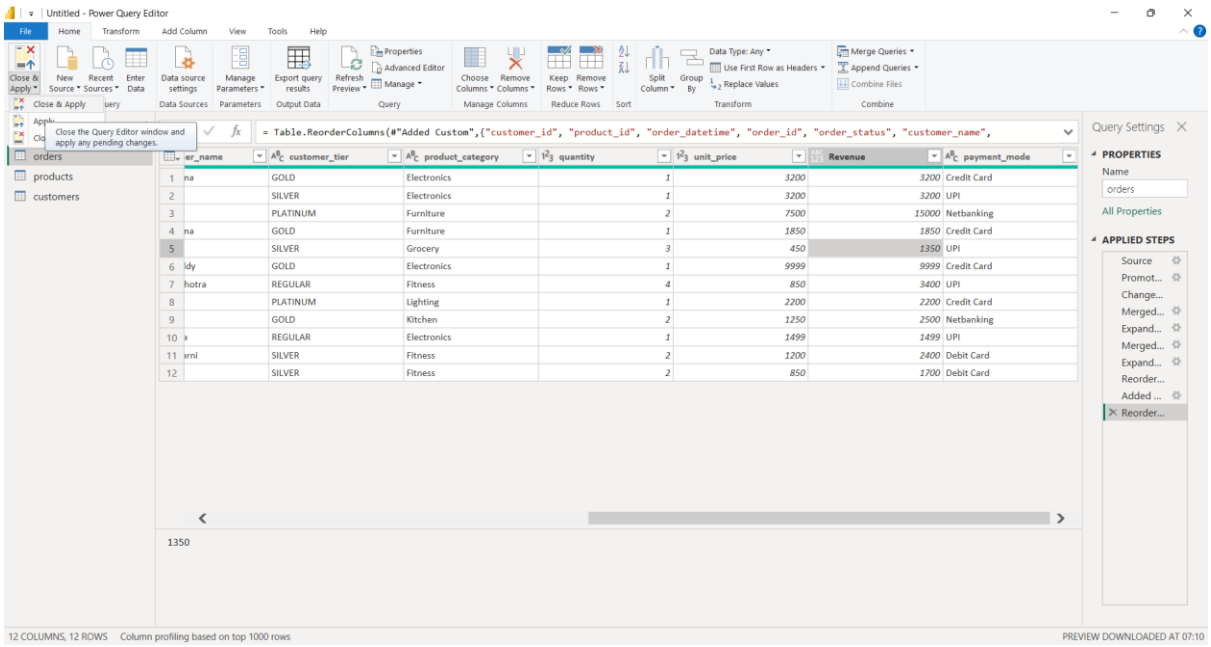

6.) Creating a custom column to calculate revenue

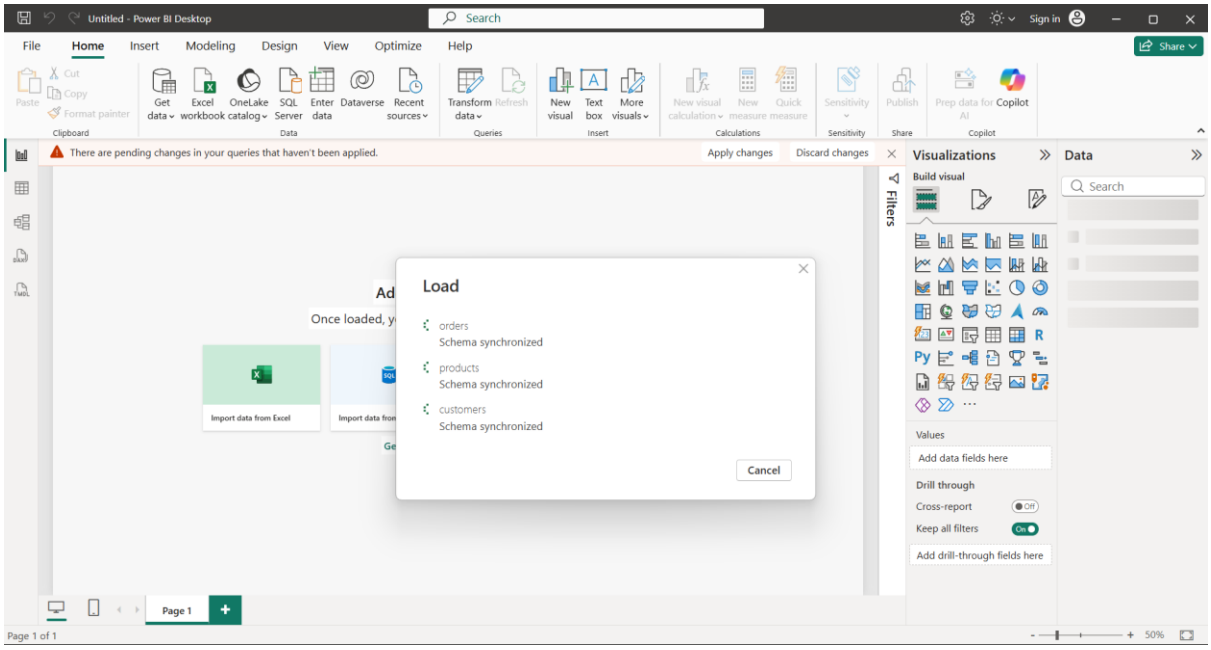

New column ‘Revenue’ populated with the value by the column formula

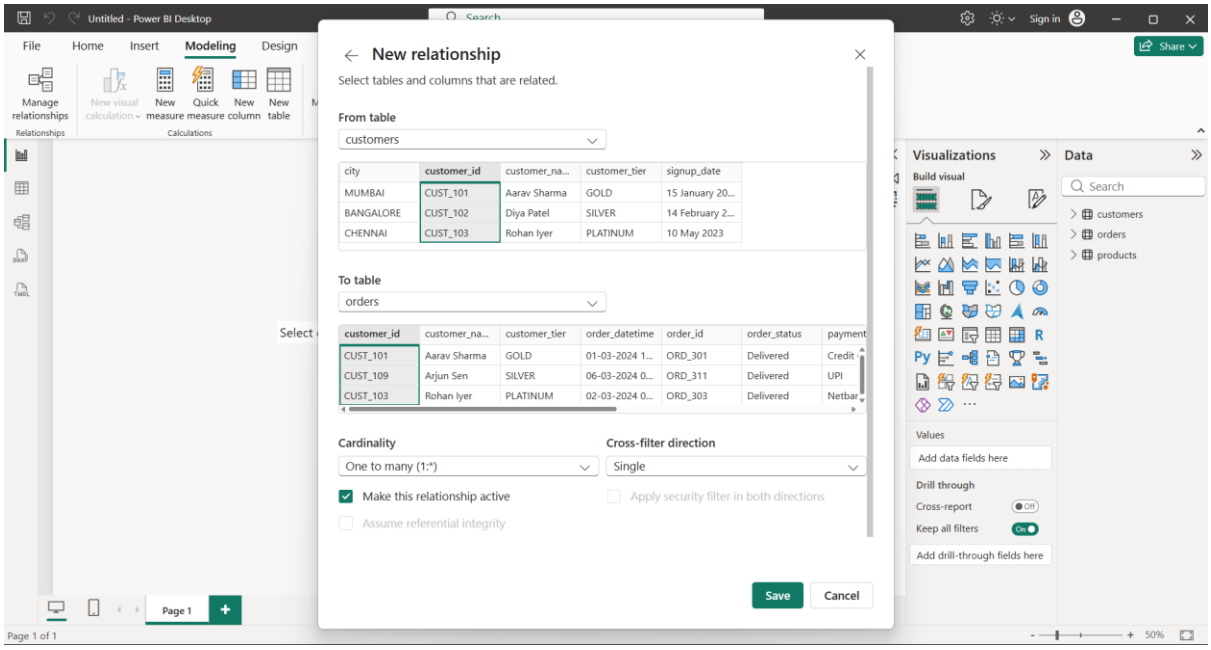

7.) ‘Close & Apply’ to exit Power Query Editor

8.) Wait for data to be loaded into Power BI desktop

9.) Create relationship between tables

10.) Create Visualization using tables and charts
