Day: 15 (02-11-2026)	**AWS VPC Setup & Management**	Documented By:
Task – 3		Sujit T K

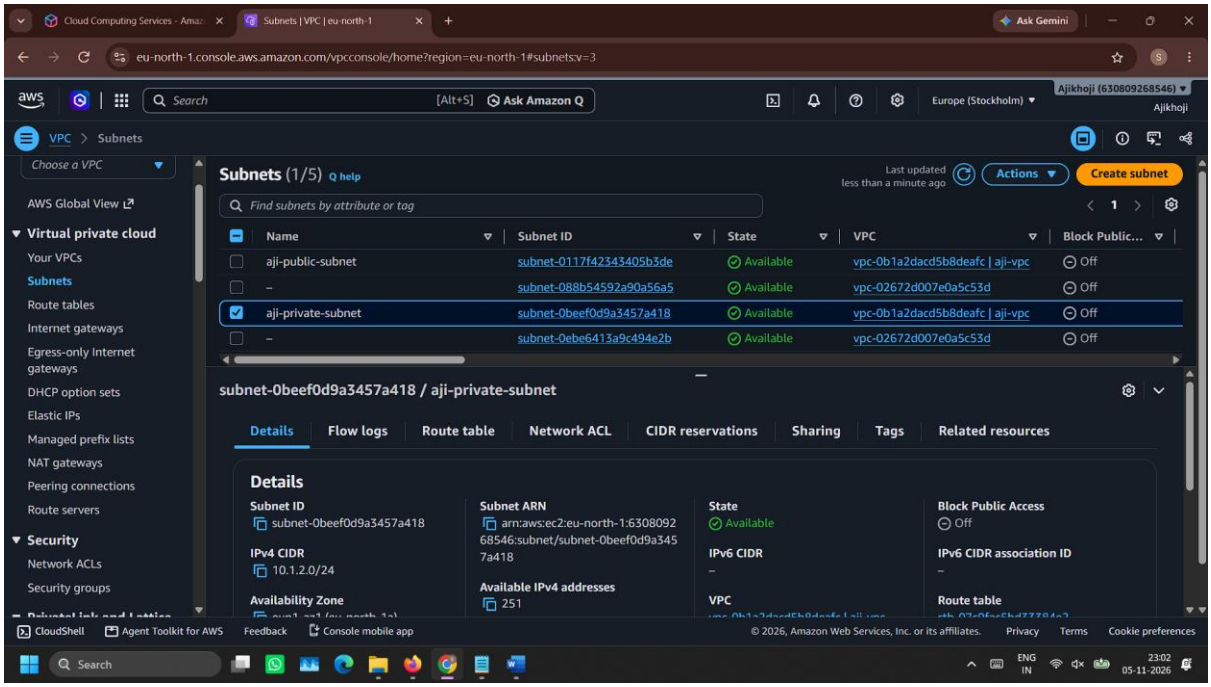

1.) Create VPC with name **aji-vpc** CIDR: 10.1.0.0/16

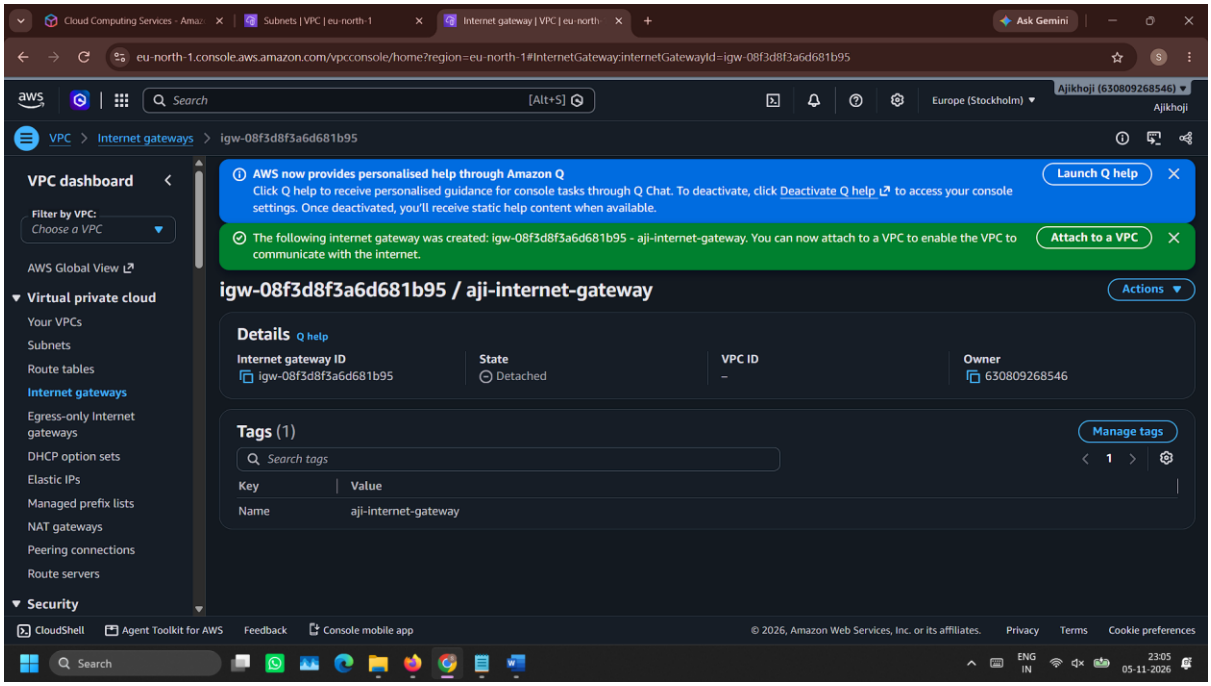

2.) Create **public** subnet with name **aji-public-subnet**

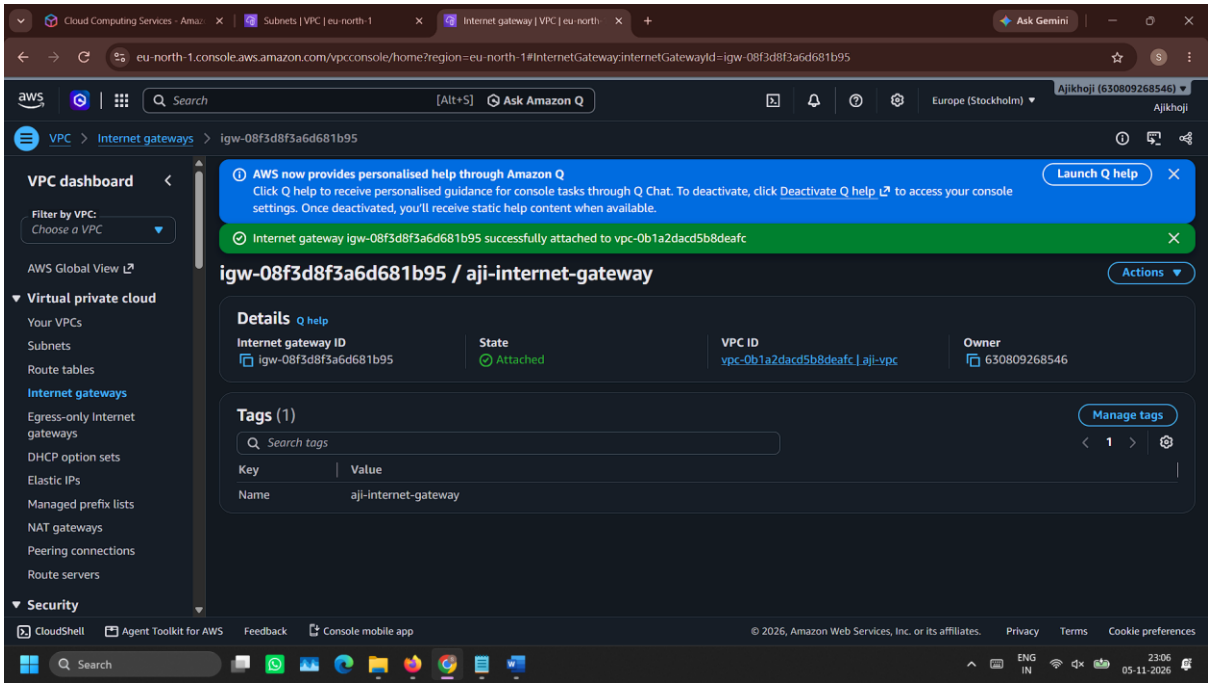

3.) Create **private** subnet with name **aji-private-subnet**

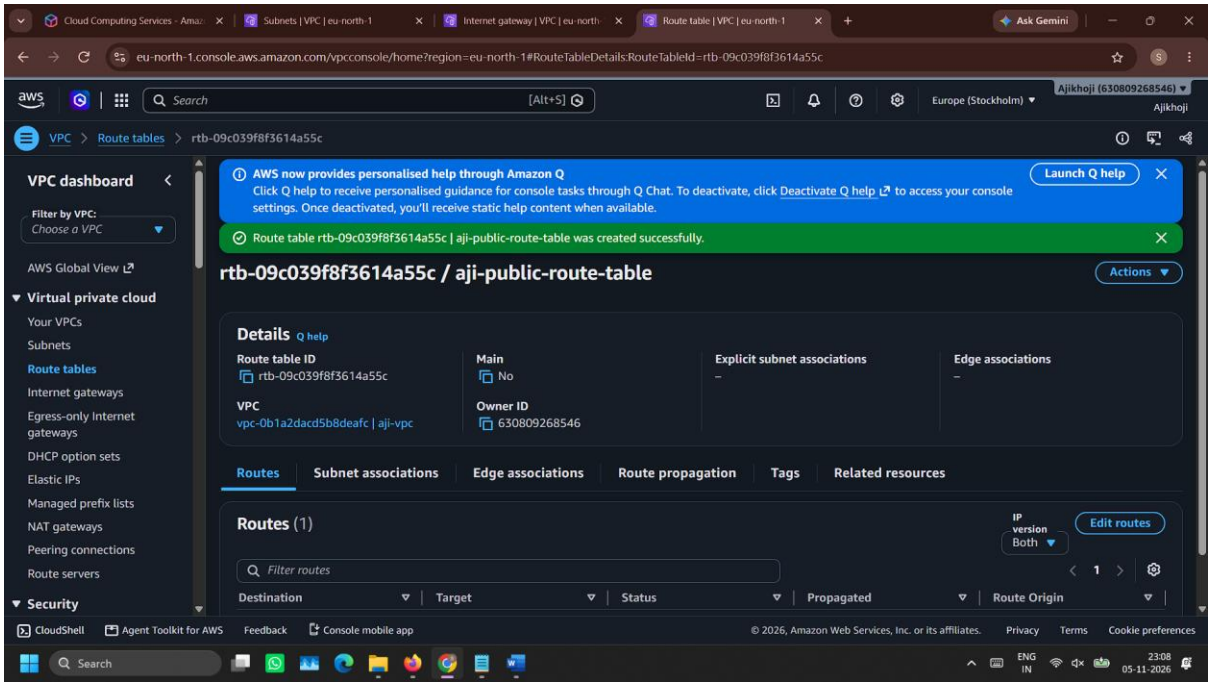

4.) Create an **Internet Gateway** named **aji-internet-gateway**

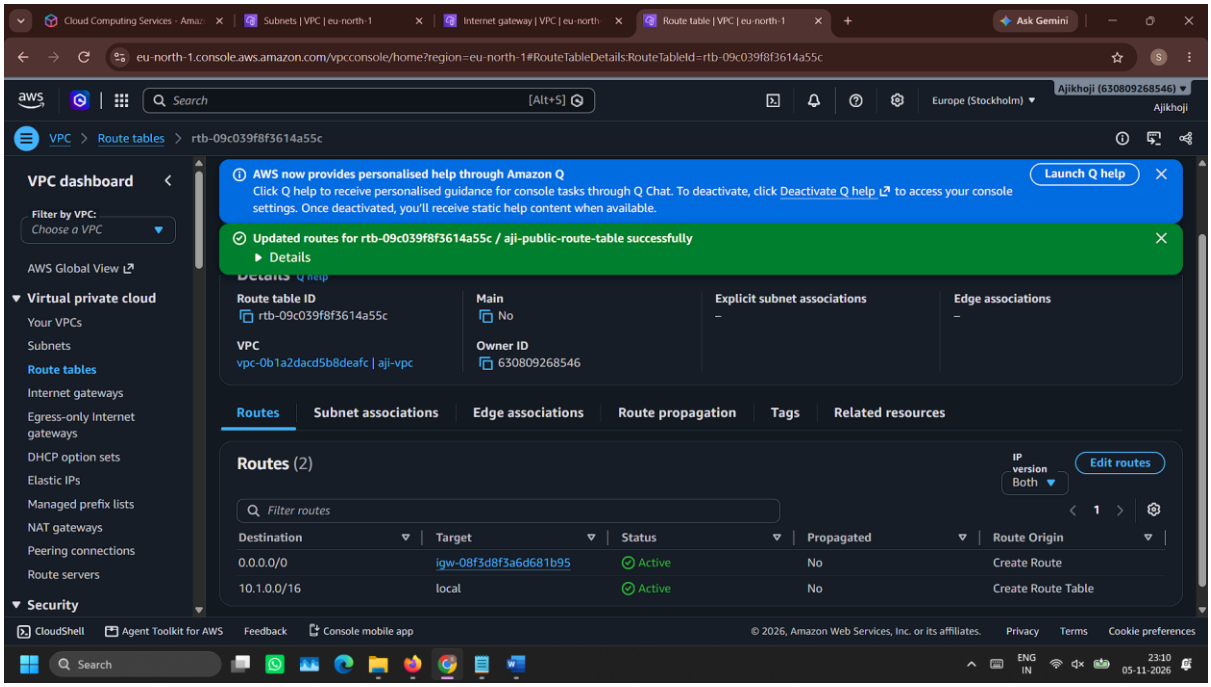

5.) Attach to VPC **aji-vpc**

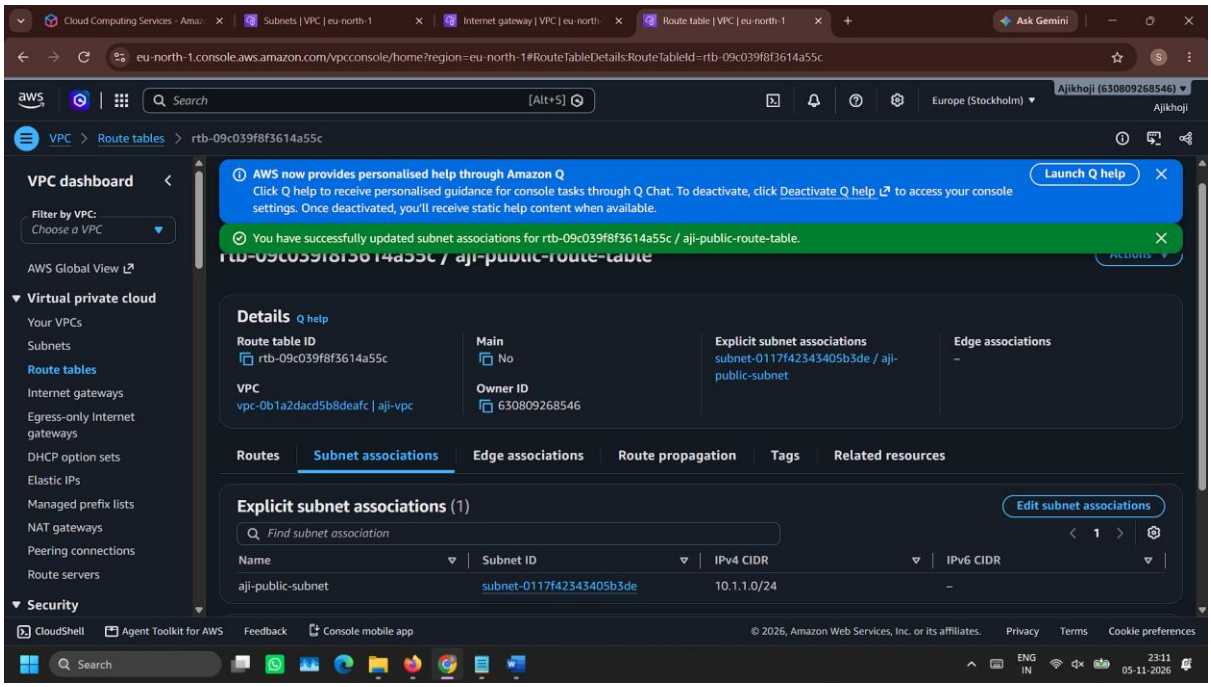

6.) Create a **route table for public subnet** with name **aji-public-route-table**

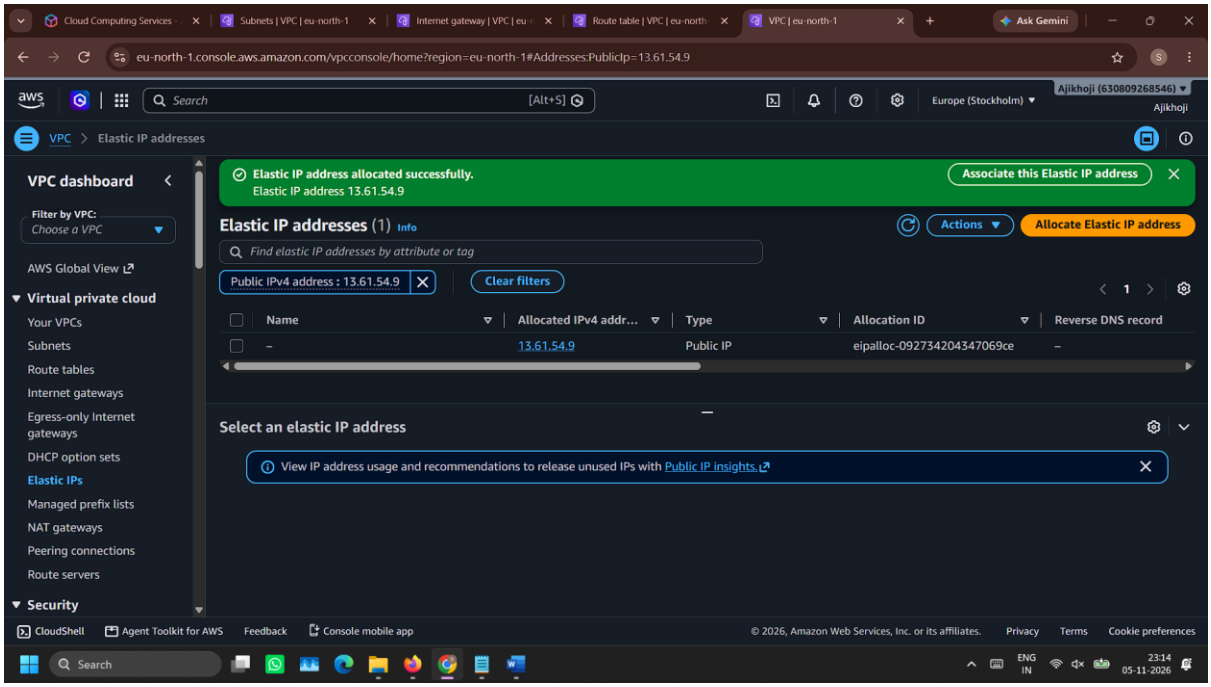

7.) Attach Internet gateway **aji-internet-gateway** to route **aji-public-route-table**

8.) Associate subnet **aji-public-subnet** with route table **aji-public-route-table**

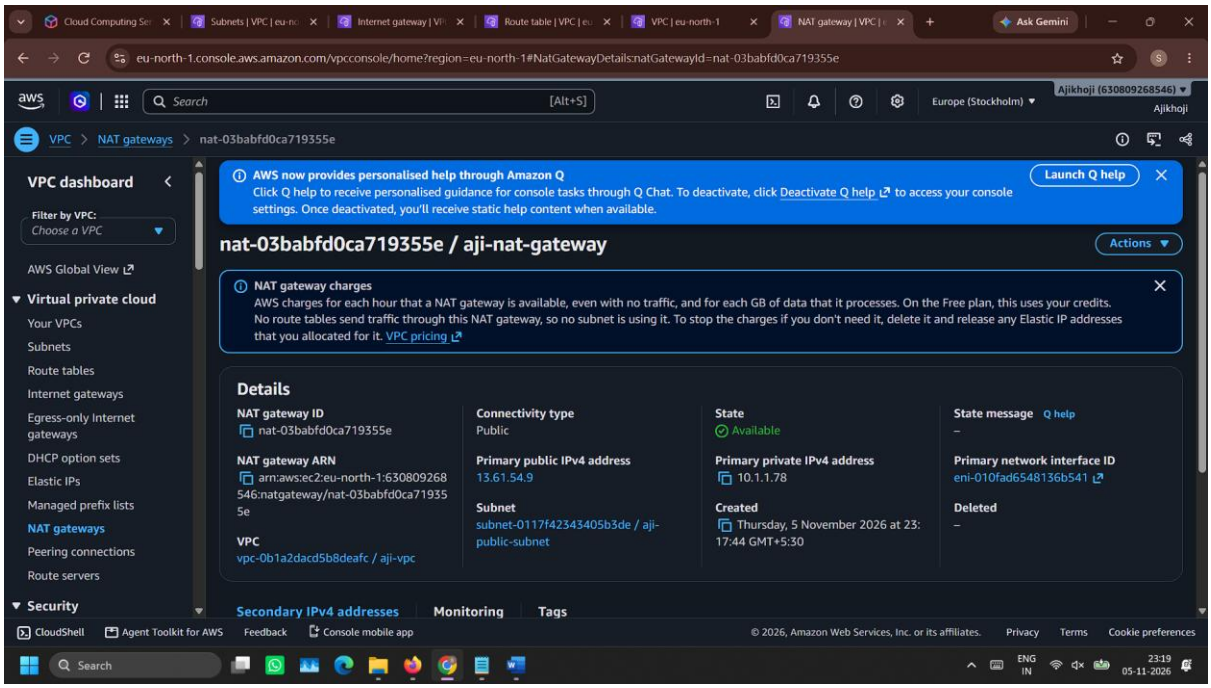

9.) Allocate **new elastic IP Address** (which will be later used in NAT)

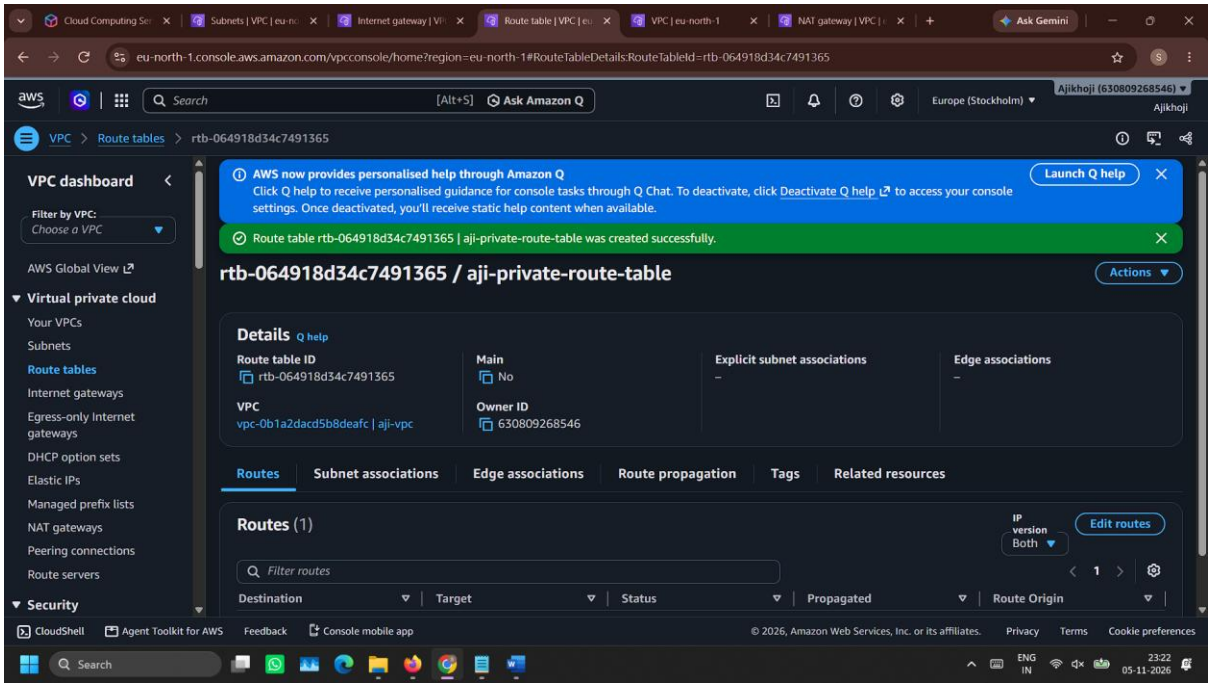

10.) **Create NAT gateway** with name **aji-nat-gateway** and choose **aji-public-subnet** as subnet

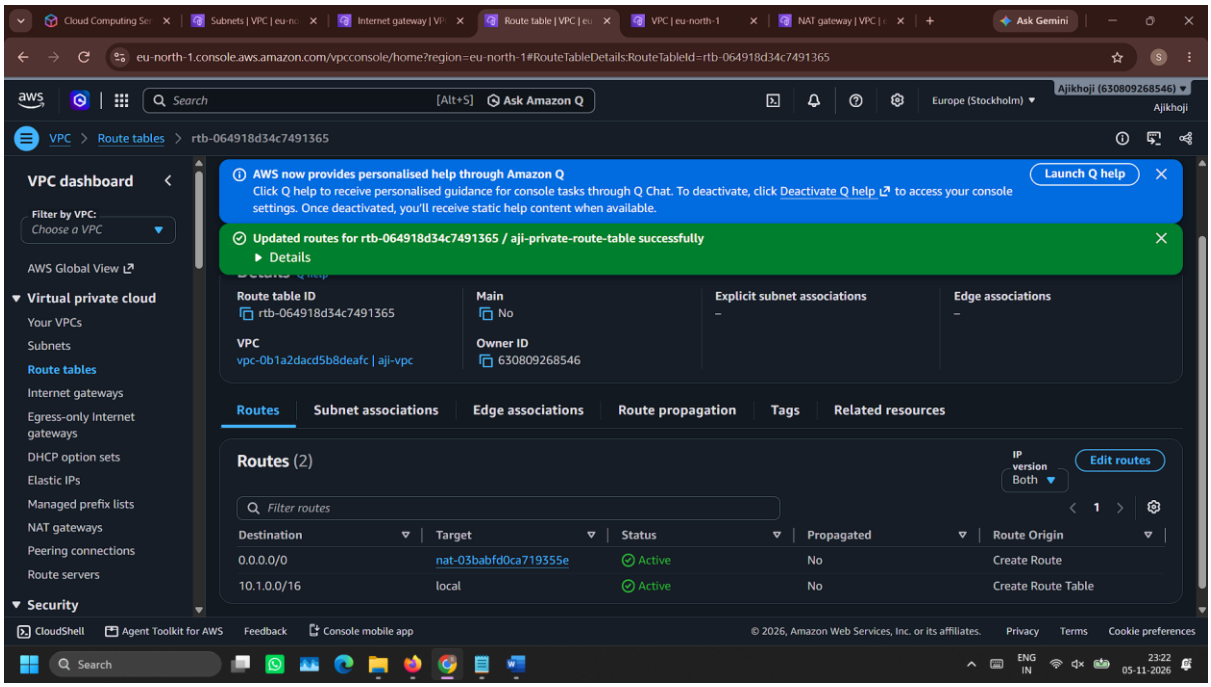

Wait for the state to become ‘Available’

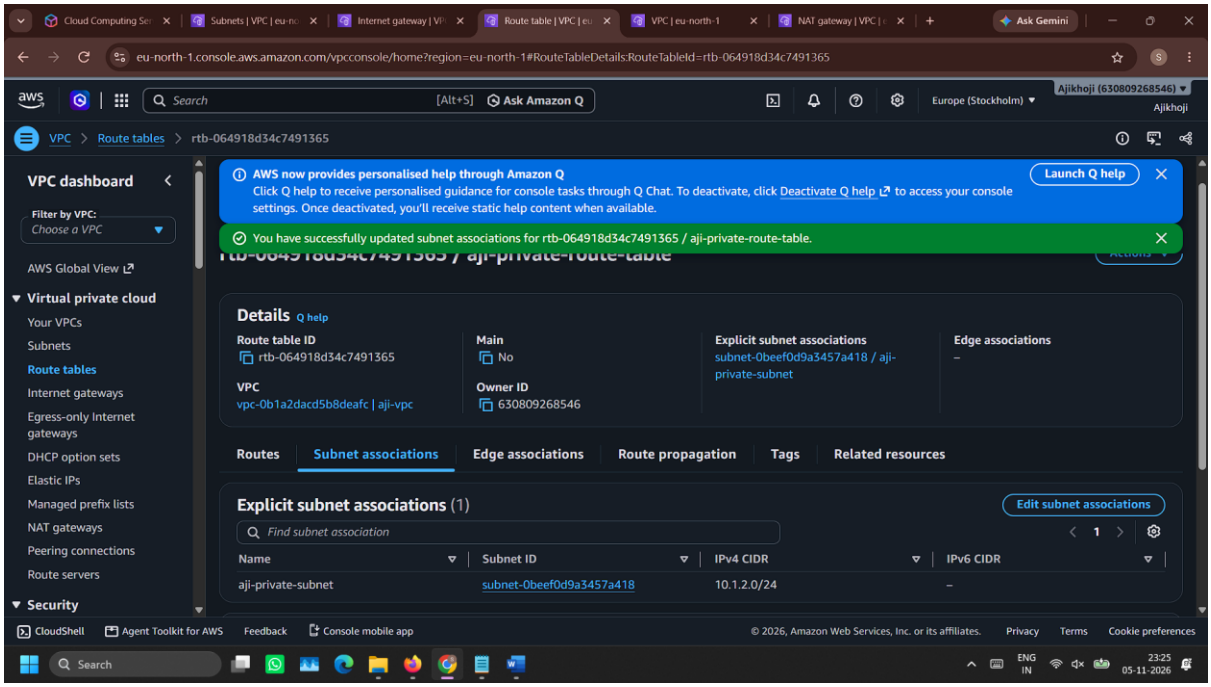

11.) Create a **route table for private subnet** with name **aji-private-route-table**

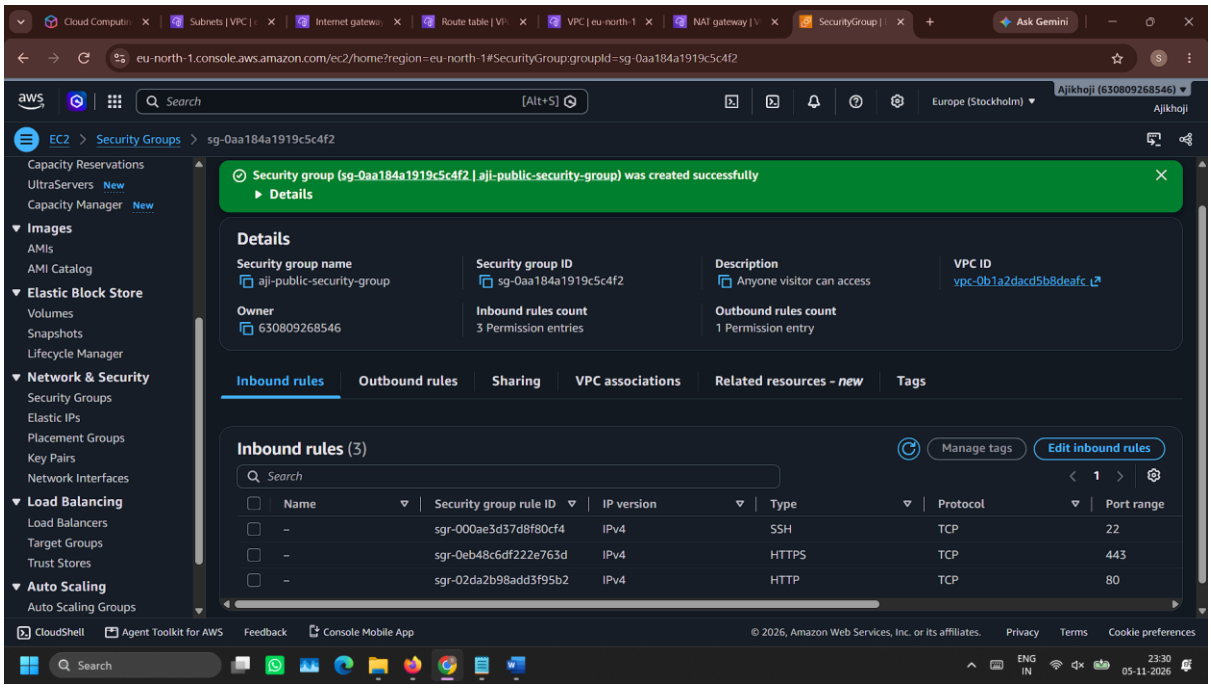

12.)Configure **aji-private-route-table** routes to **allow** NAT gateway **aji-nat-gateway**

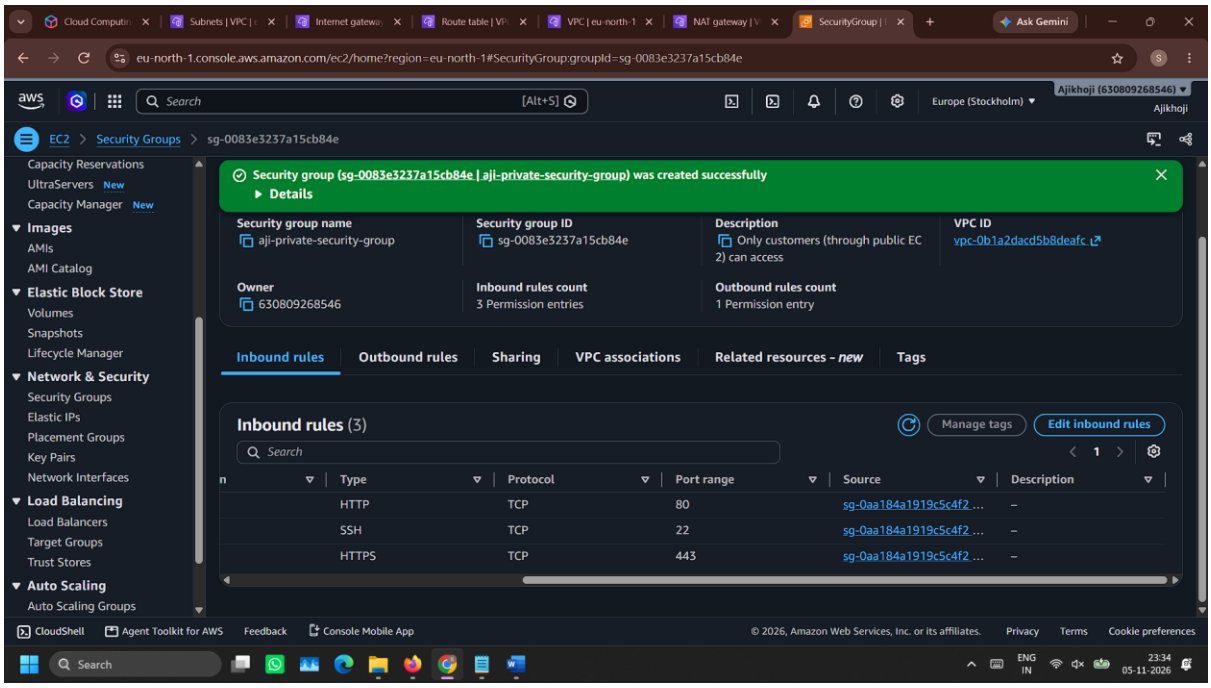

13.)**Associate** route table **aji-private-route-table** with subnet **aji-private-subnet**

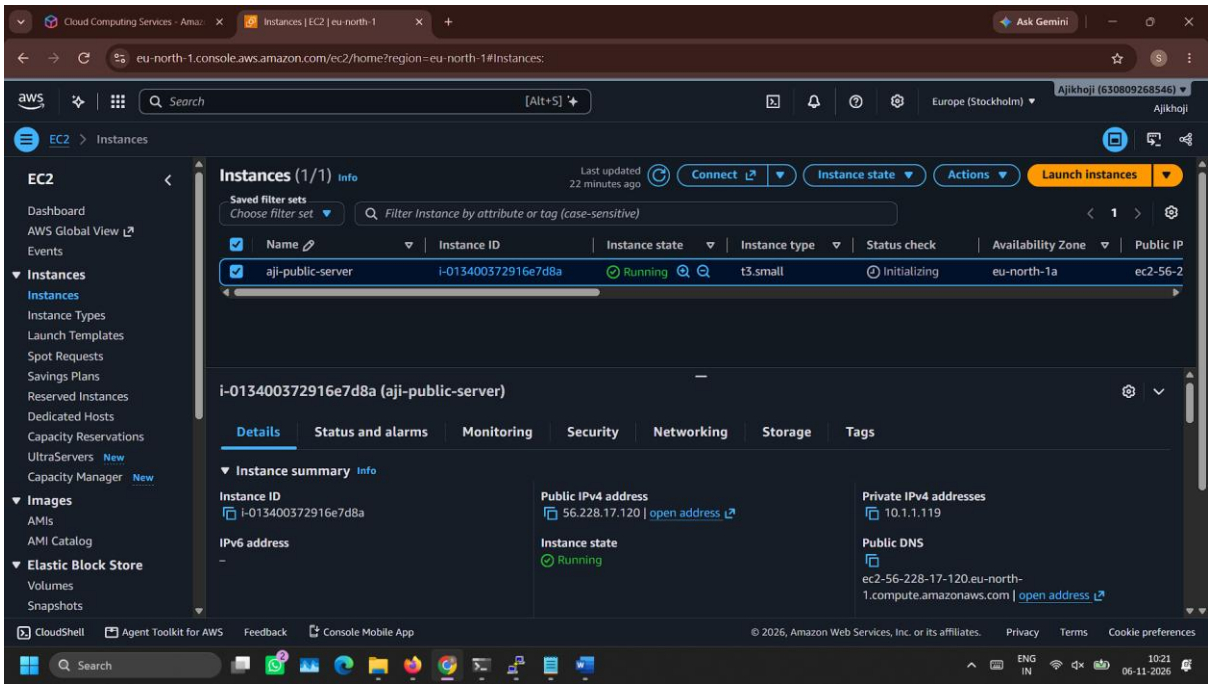

14.)Create security group **aji-public-security-group** with SSH (My-IP), HTTP (Anywhere IPv4) and HTTPS (Anywhere IPv4) configuration in inbound rule

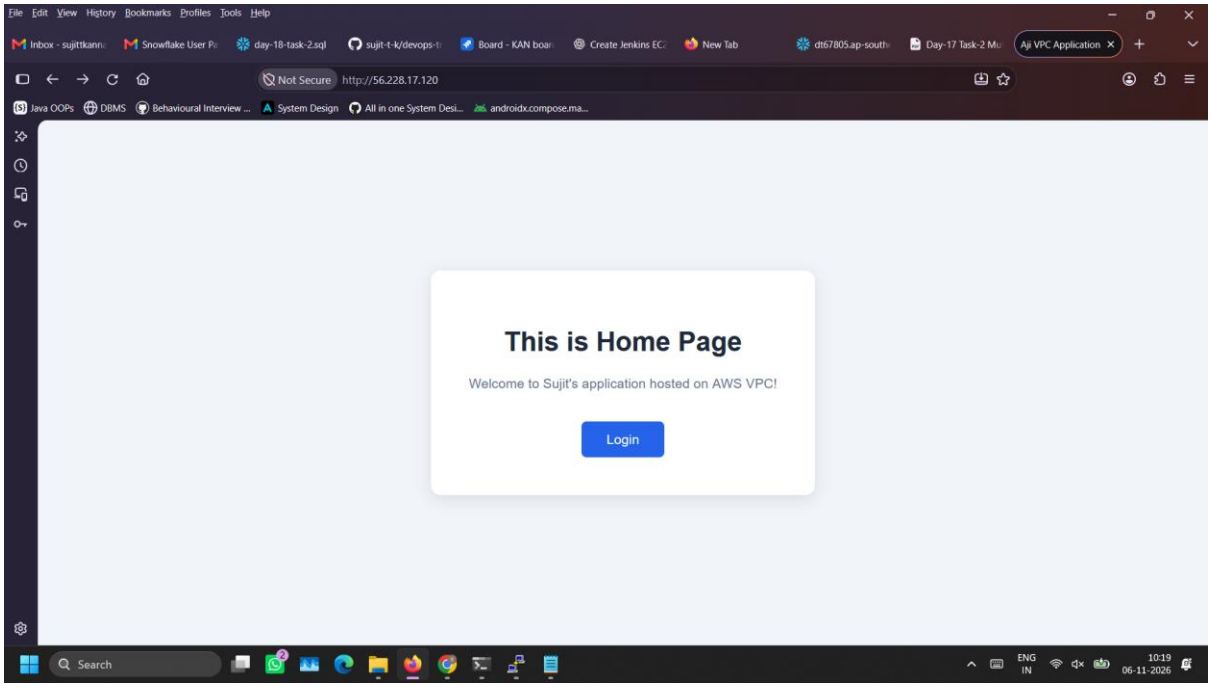

15.)Create security group **aji-private-security-group** with SSH, HTTP and HTTPS (all with aji-public-security-group as source) configuration in inbound rule

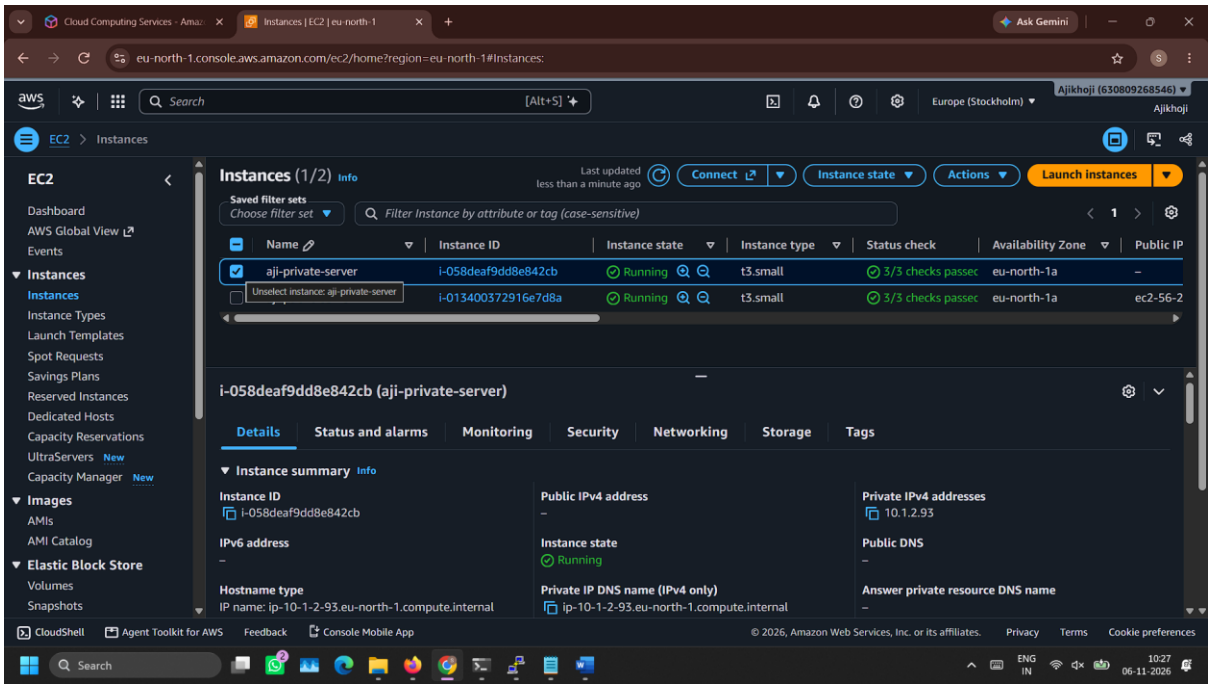

16.) **Create** an EC2 named **aji-public-server** and host publicly accessible home page.

17.)Home page hosted in public EC2

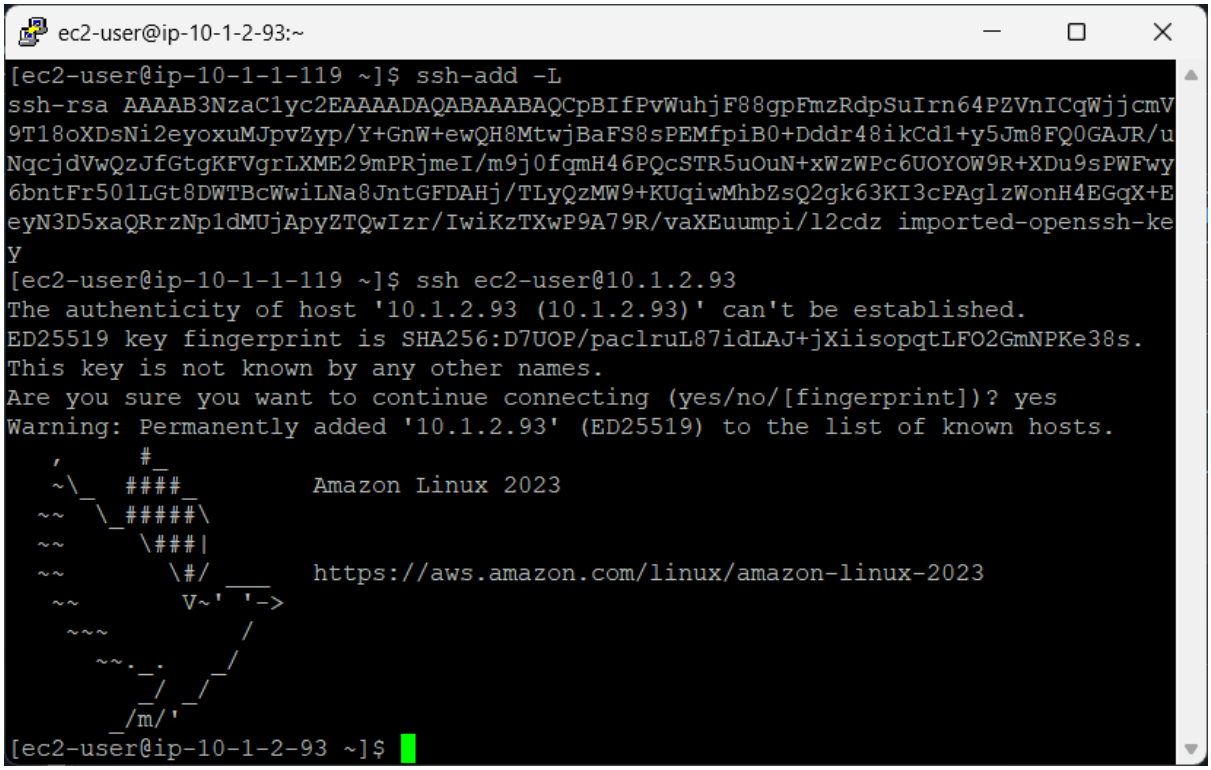

18.)**Create** an EC2 named **aji-private-server** to host login page.

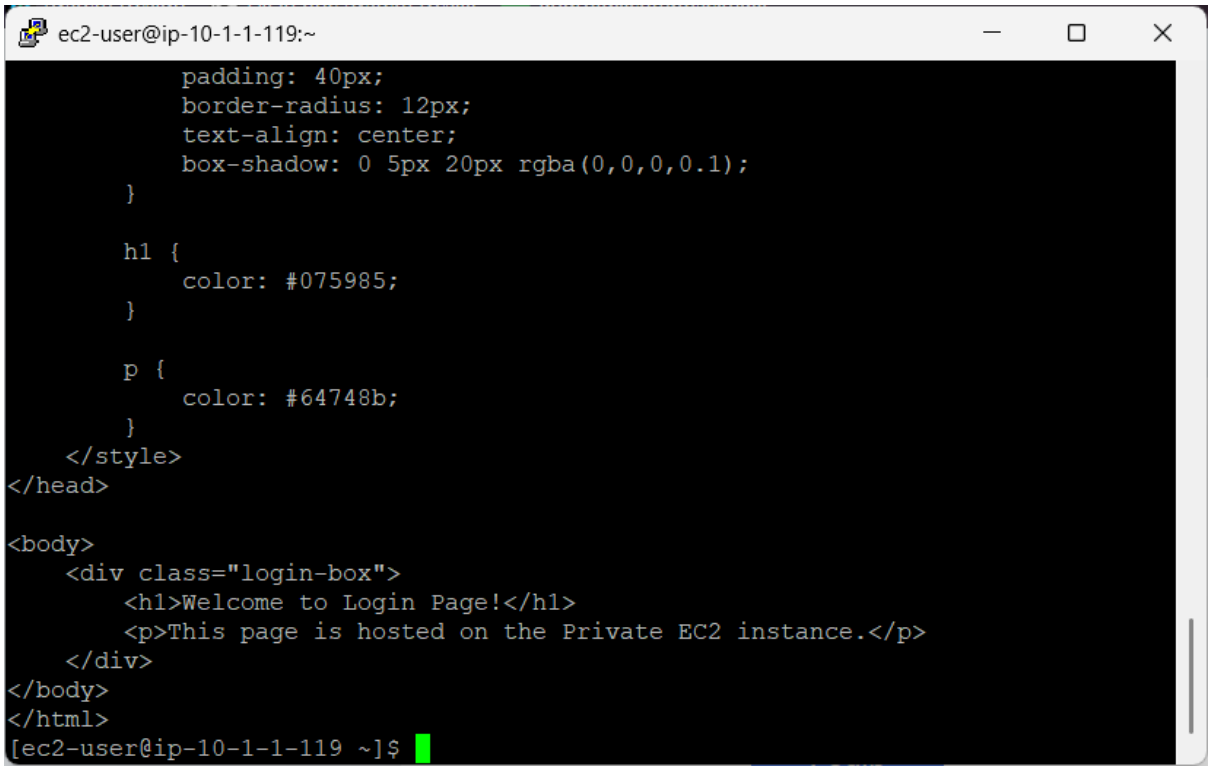

Note that there wouldn't be any public IPv4 address as it shouldn't be accessed publicly. It can be accessed only through public EC2 instance.

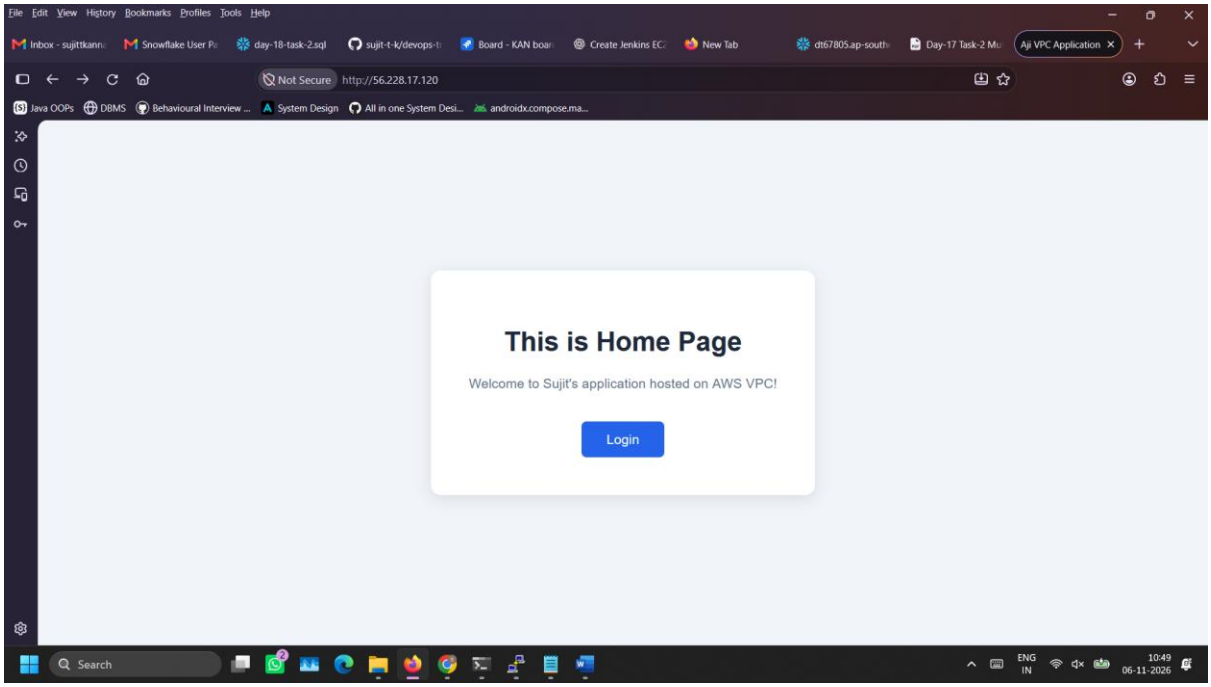

19.)Access private server's SSH from public server's SSH:

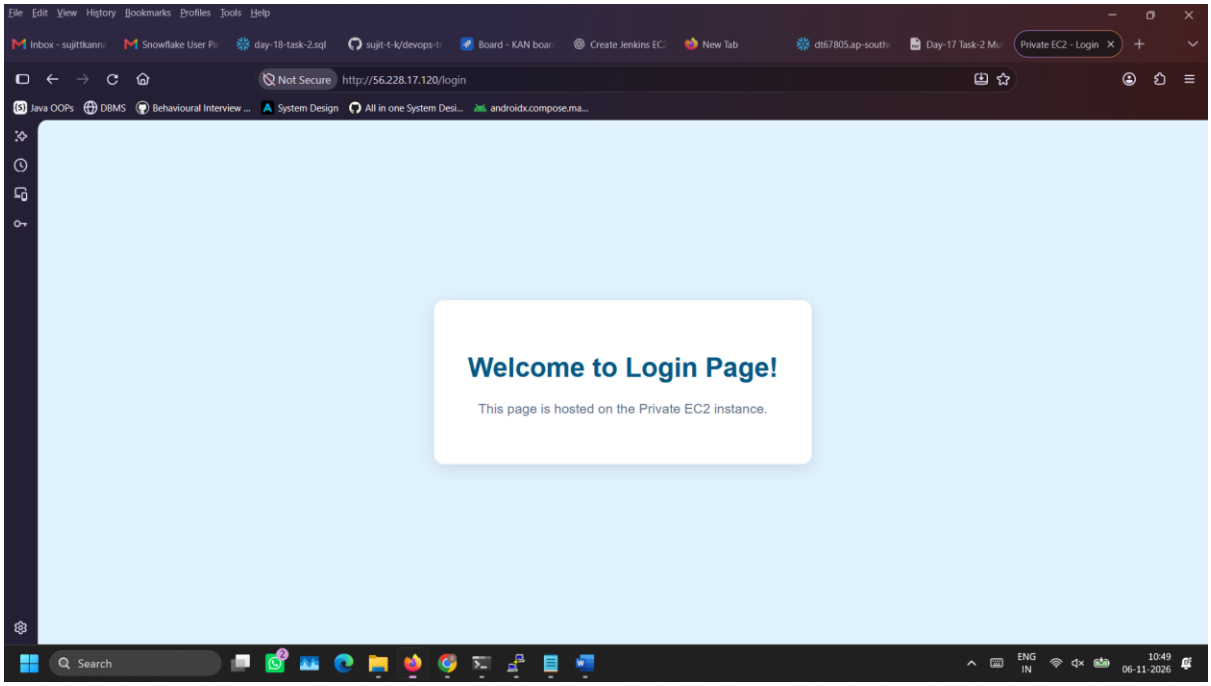

20.) Install nginx and setup Login page into private server and configure reverse proxy from public server

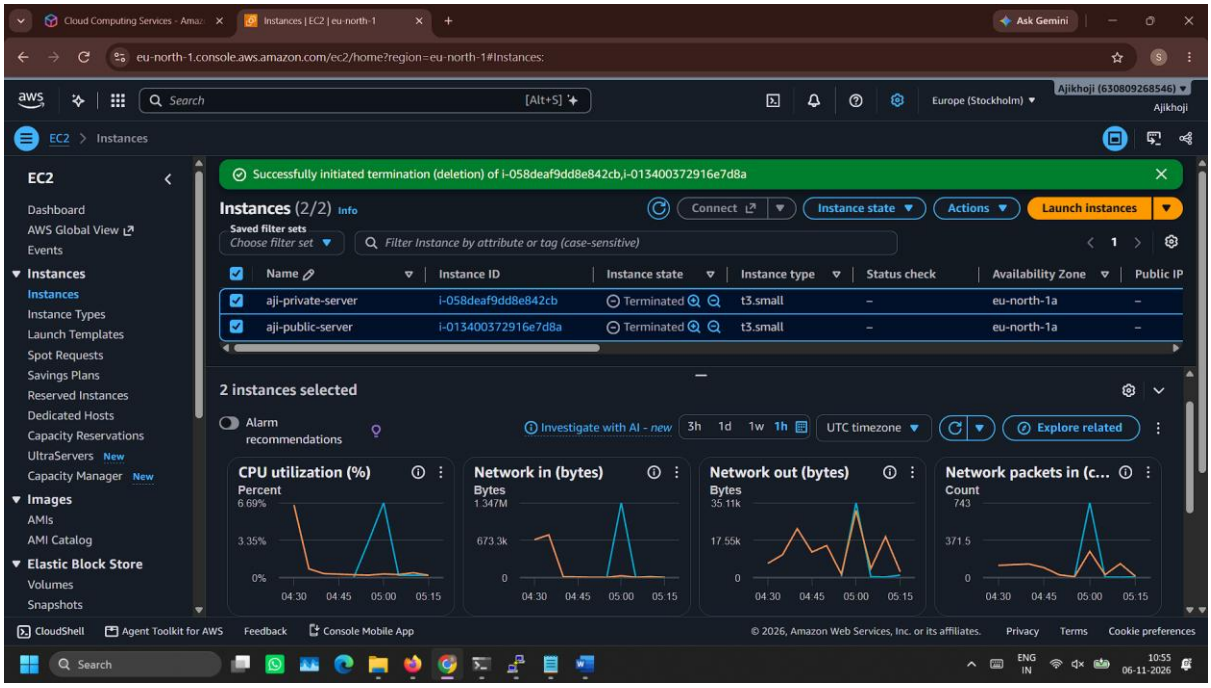

21.)Click on ‘Login button’ of home page which redirects to Login page.

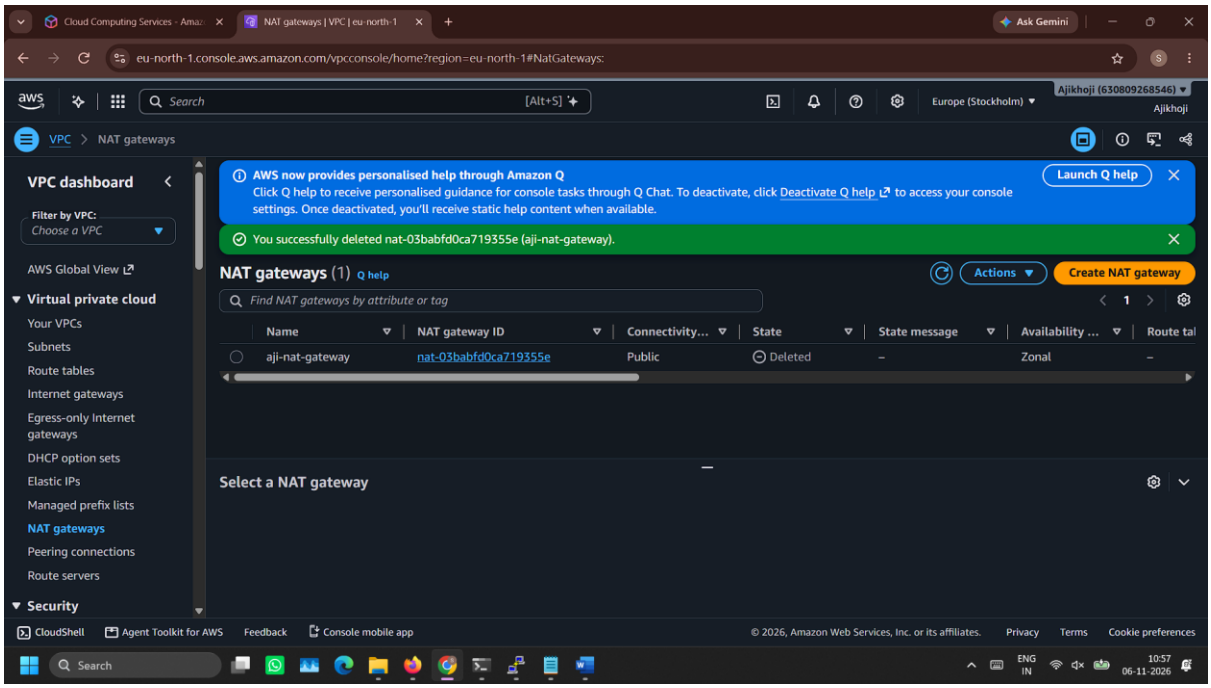

22.)Deletion of resources:

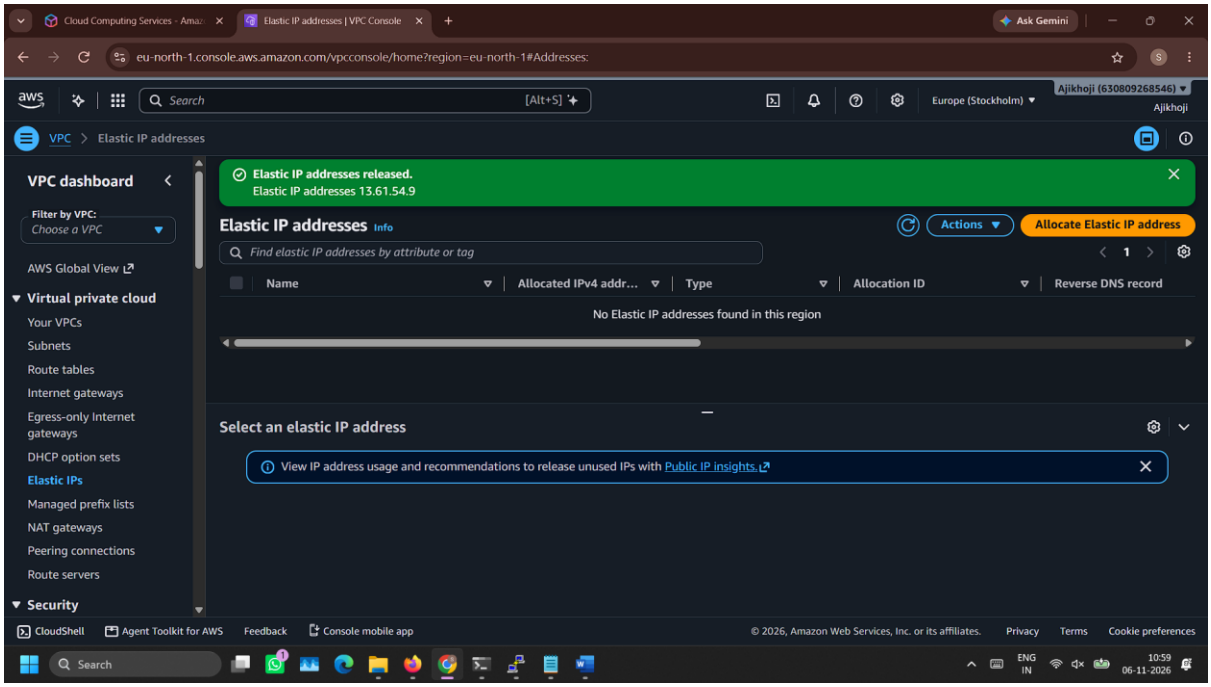

Terminate EC2 instances

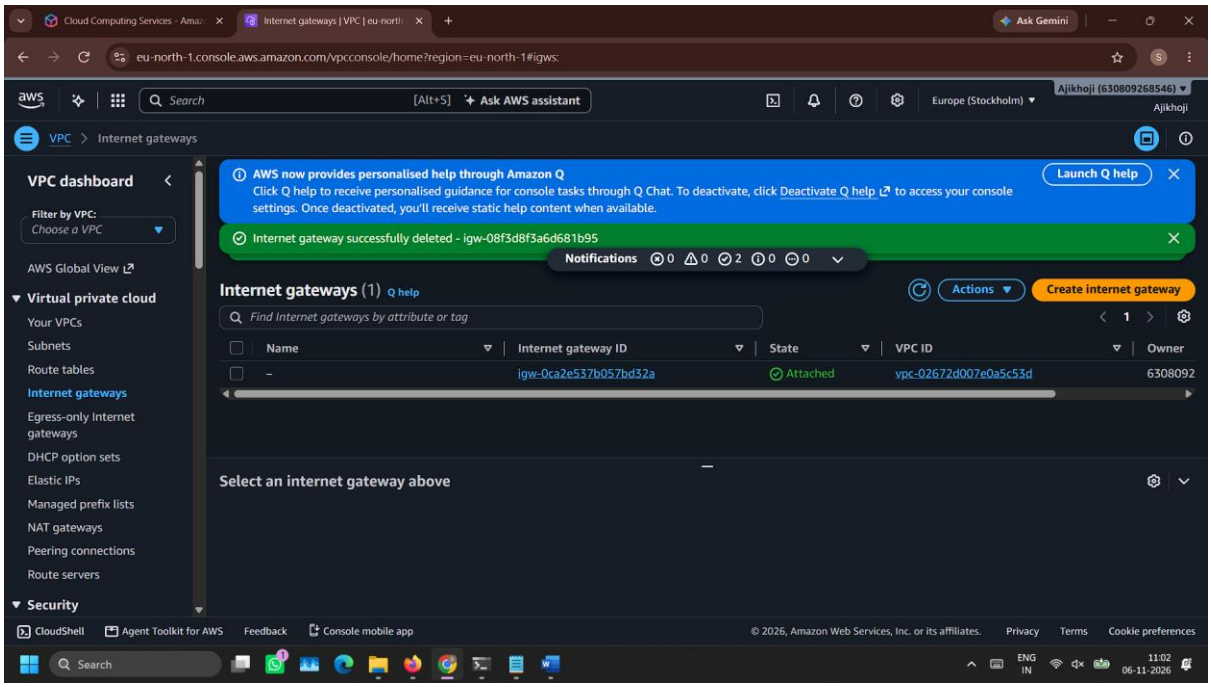

Delete NAT Gateway

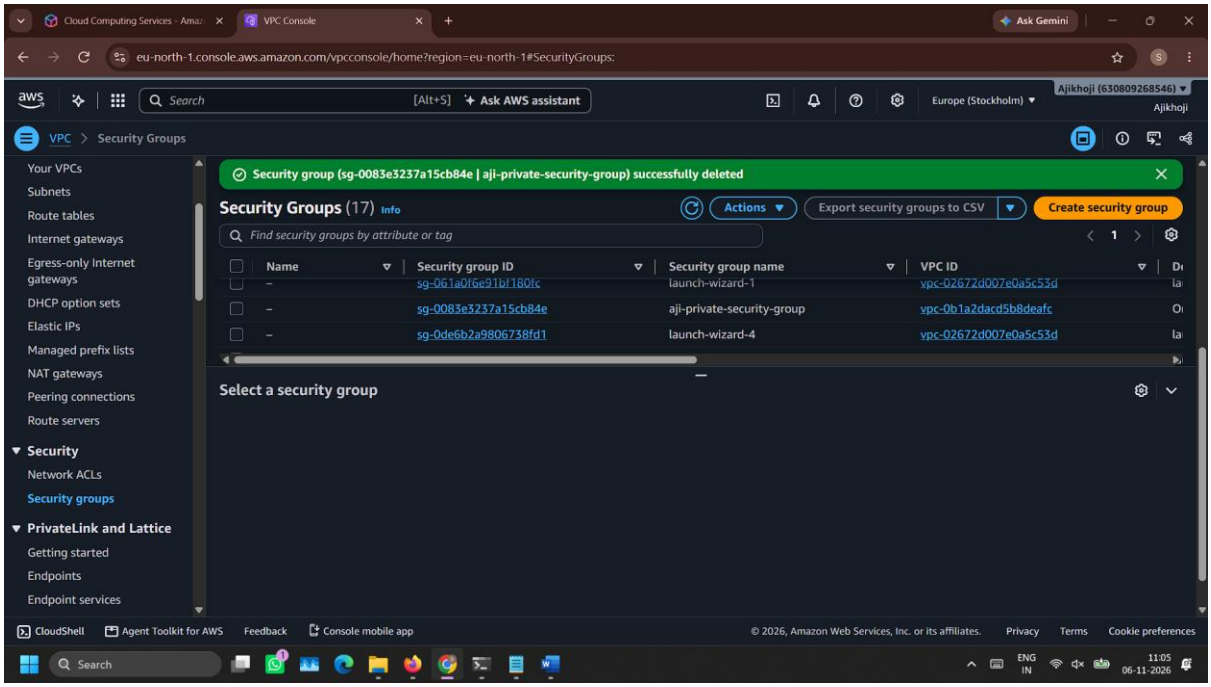

Release Elastic IP address

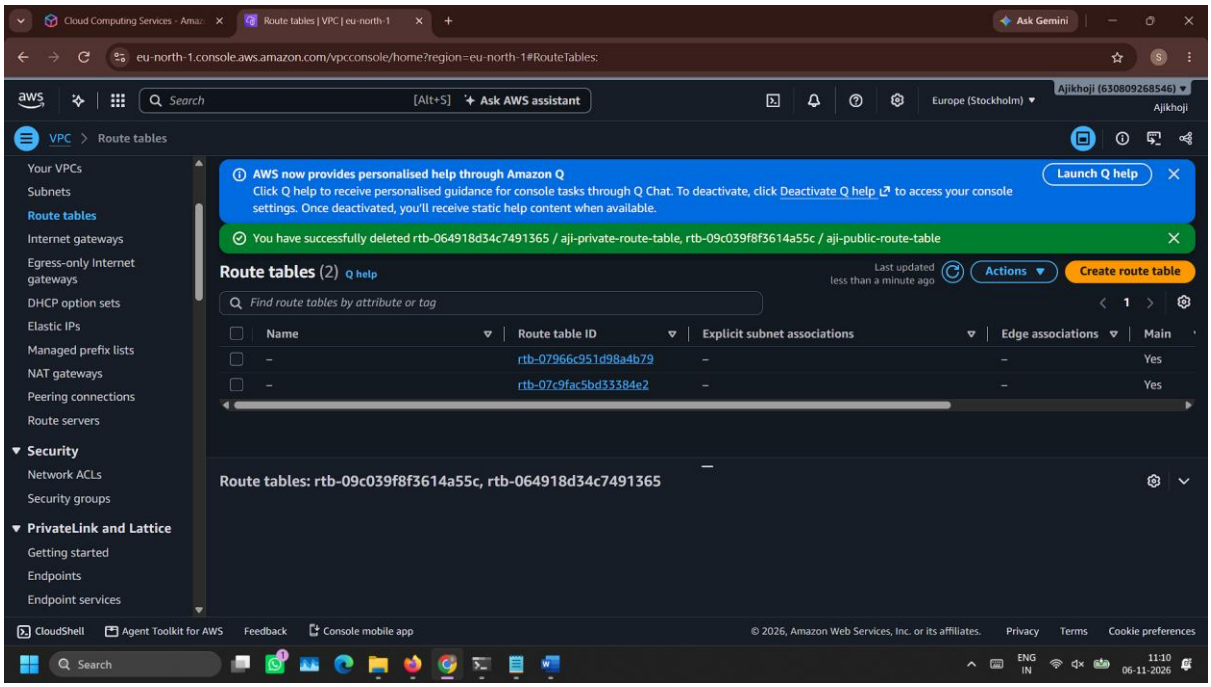

Delete Internet Gateway

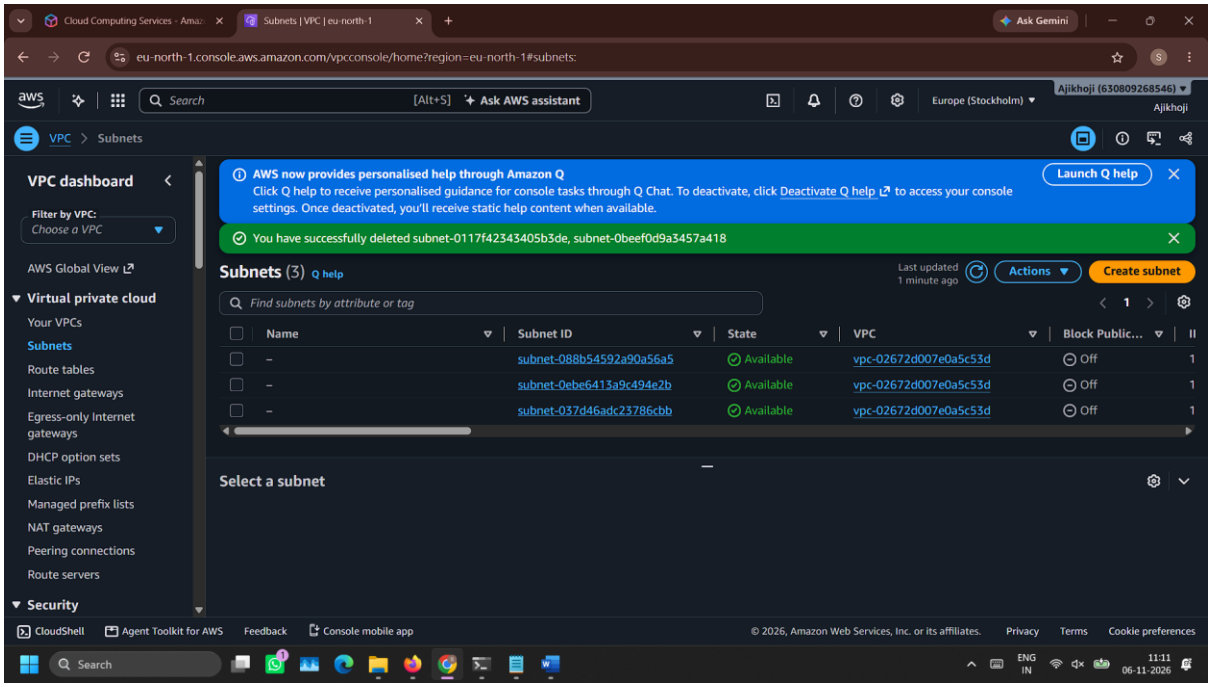

Delete security groups

Delete route tables

Delete subnets

Delete VPC
